ABSTRACT OF THE DISCLOSURE

5   **METHOD AND SYSTEM FOR VERIFYING TRANSLATION OF**
LOCALIZED MESSAGES FOR AN INTERNATIONALIZED APPLICATION

A method, a system, an apparatus, and a computer
program product are presented for facilitating
verification of translated messages and strings to be used
10   by a localized version of an internationalized
application. An application may employ messages and
strings that have been translated into different
languages as necessary for different localized versions
of the application; prior to releasing or deploying a
15   final version of the application, a user may need to
verify that the messages and strings have been translated
properly. A translation verification utility obtains a
list of one or more source files containing translated
messages or strings. The translation verification
20   utility then retrieves the messages or strings, presents
the messages or strings to a verifying user through a
graphical user interface, and allows the verifying user
to step through the translated messages or strings in
order to correct any messages or strings that have been
25   translated incorrectly.
